- (*) Logarithms (S13.1, 13.2, 13.3, 13.4) · Motivation: What is the x such that 2x = 10? Let $f(x) = 2^x$ be an exponential function, then for $f(x) = 2^x = 10$, all we want is $x = f^{-1}(io)$, where f^{-1} is the inverse function to an exponential function. Det (let b>0, b = 1 . The logarithm function g(x) = logb(x) defined for x>0, is the inverse function of fix1 = bx • That is, $\log_b(x) = y$ is the unique number y that $b^y = x$. When b=e, the natural logarithm ln(x) = loge(x) When b=10, we sometimes write log(x) = log10(x). Ex O $log_2 2 = 1$ since $2^1 = 2$. $\Theta \log_2 8 = 3$ since $2^3 = 8$. Blue = $log_e e = 1$, since e' = e. $\Theta \ln (e^2) = \log_e e^2 = 2$, since $e^2 = e^2$ Ø log10 1 = 0 she 10 = 1 6 fogro 0.01 = -2 since (0-2 = 0.01. $9 \log_{\frac{1}{2}} 8 = -3$ since $(\frac{1}{2})^{-3} = 2^{3} = 8$. · When b>1, if x>y, then loggx > loggy. Ex Estimate Logzbo. $S_{01}^{10} \cdot 2^{5} = 32 \times 60$, so $5 = \{09.32 \times 909.260\}$ · 26 - 64 7 60, so logs 60 < logs 64 = 6. · 50 52 log260 26 and it's closer to 6. (log, 60 25.4). · Algebraic rules for logarithmy:
 - Let b>0 and $b\neq 1$. Then:
 log b=1, $(b^0=b)$ log b=0. $(b^0=1)$

```
Then let b>0 and b+1 then for any x,y>0, any le real:
       O logy (xy) = logy (x) + logy (y).

\frac{\partial}{\partial y} \log_b(\frac{x}{y}) = \log_b(x) - \log_b(y).

       3 logb (x/k) = le logb (x).
       1) Note e^{\log_b(x)} = x, e^{\log_b(y)} = y,
        then e^{\log_b(x) + \log_b(y)} = e^{\log_b(x)} \cdot e^{\log_b(y)} = x \cdot y.
        this implies logo(xy) = logo(x) + logo(y).
       2 Similar to O.
       3 Note b^{l \circ g_b(x)} = x. Then b^{l \circ g_b(x)} = (b^{l \circ g_b(x)})^k = x^k.
       So logo(xk) = klogo(x).
   Ex 9 log_2(16) = log_2(24) = 4log_2(2) = 4(1) = 4.
       (2) 5(\log_5(x^4) + \log_5(x^2)) = 5(\log_5(x^4) + \log_5(x^2)) = x^4 \cdot x^2 = x^6
       3e^{-\ln(\sqrt{x})} = \frac{1}{e^{\ln x}} = \frac{1}{\sqrt{x}}.
4h(x^3-1) - \ln(x-1) = \ln(\frac{x^3-1}{x-1}) = \ln(\frac{(x/1)(x^2+x+1)}{(x-1)})
           = ln (x2+x+1).
     · Ohonge of base: logarithm can be written using logarithm with other bases
Thun. Let b, k be positile but not 1. Then
                \log_b x = \frac{\log_k x}{\log_k b}.
    • A most frequently used form: k = e : log_b(x) = \frac{lu x}{lu b}.
  Pt: Let log 5 x = c. Then b = x. Take logk over each side:
        logubc - logux,
        cloqub = logux,
            C = logk x Cos desired.
```

Ex Solve
$$2^{4x-1} = 31$$
 wing $\ln x$.
